# SIMOG Enterprise Procurement Platform

Architecture, Capabilities, and  
Operations Overview

# A Mission-Critical Enterprise Asset

## Comprehensive Lifecycle

End-to-end management of procurement procedures, granular lots, and administrative phase transitions.

## Extreme Interoperability

Seamlessly connects public-sector systems via robust, high-performance SOAP and batch interfaces.

## Proven Reliability

A battle-tested architecture designed for high-volume, regulation-compliant operational processing.

# End-to-End Procurement Lifecycle Management

# Versatile Omni-Channel Architecture

|              | Human Interaction                                                                                                                    | Machine Interaction                                                                                                         |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Synchronous  | <b>Web UI (SimogWeb)</b><br>Feature-rich, session-managed interface driving the primary Scheda workflow for authenticated operators. | <b>SOAP Services</b><br>High-performance synchronous APIs for machine-to-machine integration and external aggregator flows. |
| Asynchronous | <b>Mass Loader (Batch)</b><br>High-throughput automated XML ingestion pipeline for operational bulk data.                            | <b>TED Subsystem</b><br>Dedicated JPA-backed processing engine for EU-standard publication synchronization.                 |

# The Centralized Business Rule Engine

## Centralized Domain Logic

Core rules are concentrated in robust orchestrators (GaraManager, LottoManager), ensuring absolute behavioral consistency across Web, SOAP, and Batch channels.

## Unified Validation

The WorkFlowController and dedicated validators act as the ultimate gatekeepers, strictly enforcing procedural state transitions.

## Fine-Grained Data Access

The custom AccessiDB architecture provides precise, application-managed transactional control for peak data integrity without ORM overhead.

# Unmatched Ecosystem Connectivity

# Multi-Modal, Secure Access Control

## Interactive Web Security

Rich profile-based authentication managed via SrvAutentica, seamlessly supporting Local, Remote, and modern IAA/IAM integration paths.

## Machine-to-Machine Security

Dedicated Web Service Ticket lifecycle. The WSSessionManager generates, tracks, and validates database-persisted ticket states (S, I, P, E) to guarantee authorized API execution.

# European Integration via the TED Subsystem

## Dedicated Architecture

Operates as a highly cohesive, specialized bounded context (SimogTEDCommon & SimogWSTED).

## Modern Persistence

Utilizes standard JPA entity modeling for streamlined database interactions.

## Automated Compliance

Automatically generates, validates, and transmits XML notices based on complex system deltas to keep EU publications perfectly synced.

# High-Volume Automated Mass Processing

## The SimogMassLoader

A dedicated, independent batch runtime designed for massive organizational data ingestion.

## Strict Schema Contracts

Validates all inbound payloads against rigorous XSD contracts before processing begins, ensuring zero bad data enters the core.

## Fault-Tolerant Traceability

Automatically generates detailed processing feedback and maintains strictly isolated operational workspaces (IN, OUT, WRK, BKP).

# Ready for the Next Chapter

## Embedded Domain Wealth

Decades of complex, verified public procurement rules and regulatory transitions are already safely codified and functioning flawlessly within the system.

## Rock-Solid Contracts

Well-defined WSDL and XSD artifacts ensure absolute stability and predictability for all external integration partners.

## Modular Foundation

Clear physical separation of Web, SOAP, Batch, and TED components provides distinct boundaries for targeted future enhancements and seamless scaling.
